IMV Projects to provide EPCM services to AltaGas Ltd. for a 120 MMcf/d processing facility in the Gordondale area of Alberta

IMV Projects has been selected by AltaGas Ltd. to provide full EPCM services on their Gordondale gas processing facility and associated gas gathering system. This 120 MMcf/d sour gas facility is located approximately 100 km NW of Grande Prairie in the Gordondale area of the Montney resource play. The project is valued at \$235MM and is expected to be on-stream by the fourth quarter of 2012, pending regulatory approval.

IMV Projects has been closely involved with the development of this project since its inception. AltaGas initiated dialogue with clients in the Gordondale area in 2009 and IMV Projects has been closely supporting the work as it evolved and progressed. Our familiarity with the project made it easy for IMV Projects to start detailed engineering this summer. We have also been heavily involved with helping AltaGas secure regulatory approvals for the Gordondale Project.

Gas processing is technically demanding work and projects with deep cut facilities, such as Gordondale, require highly sophisticated equipment. The Gordondale Project allows us to showcase our gas processing capabilities and help build our reputation as a balanced oil *and* gas project execution provider for the energy industry.

IMV Projects' relationship with AltaGas began in 2006. Over the years, we have successfully completed CBM plant work and provided AltaGas with EPCM services for their AnteCreek sour gas plant expansion.

We look forward to our work on Gordondale, as well as continuing to grow our valued relationship with AltaGas.
